

## Indicators of the current global warming fraud are as follows:

1. Carbon dioxide (“CO<sub>2</sub>”) is a greenhouse gas. At 4 one hundredths of one percent of the atmosphere it is only a trace gas, so CO<sub>2</sub> has minimal, perhaps un-measurable influence on climate change. 70% of all greenhouse gas influence is wielded by water vapour suspended in the atmosphere together with clouds (that are little understood), and there is evidence that fluctuations in earth’s cosmic ray influx (which becomes greater during periods of low solar activity – i.e. now) is what determines cloud formation. IPCC models use a notional feedback impact for CO<sub>2</sub> influence which means they quadruple the theoretical greenhouse effect in order to justify their attack on a gas which is essential for all life on earth.
2. Methane (“CH<sub>4</sub>”) is only an insignificant greenhouse gas. At 2 thousandths of one percent of the atmosphere it is not only a tiny trace gas but it is rapidly converted into either CO<sub>2</sub> or water vapour. Vilification of CH<sub>4</sub> is a place where the battle against pollution is deliberately being conflated with the current climate fraud. IMHO, our farmers are being deliberately lied to... presumably so they can be taxed.
3. The Al Gore promoted proposition that the correlation between the graphs of CO<sub>2</sub> and temperature from the Vostok ice core studies of the 1990s supported the theory that more CO<sub>2</sub> drives earth’s climate has been comprehensively disproven. This is because the changes in temperature throughout both the analyses of Vostok samples and the Greenland ice core samples always preceded the changes in atmospheric CO<sub>2</sub>. Not the other way around. The sea contains 50 times as much CO<sub>2</sub> as does the atmosphere and, as with all liquids, gives off CO<sub>2</sub> when warming and slowly takes it up when cooling. This is why at the end of the last Ice Age 11,500 years ago, atmospheric CO<sub>2</sub> dropped to 180ppm – only just enough to support life on earth. Much more CO<sub>2</sub> is being naturally sequestered in rocks, and the evidence of millennia is that atmospheric CO<sub>2</sub> is reducing with each ice age. At 412 ppm today CO<sub>2</sub> is low in the terrestrial experience of history, even though that level already shows a 130ppm increase since the start of the industrial revolution.
4. There is also no correlation between the present continued increase of atmospheric CO<sub>2</sub> and modern temperature fluctuations. The true drop in global atmospheric temperatures during the period 1940-1975AD occurred at a time when there was a considerable increase in both industry and atmospheric CO<sub>2</sub> following WW2. The same example occurred during the 14 years after 2000AD. 2016 was a warm year (like 1998) due mainly to a strong El Nino event but the two years since have seen a cooling trend. The warming used as justification for the Anthropogenic Global Warming Fraud occurred during the period from 1976 to 2000 when the extremely active solar cycles (numbered 20, 21 and 22) occurred. On their own, the solar cycles should have been credited with this modern warming. The down-playing by the early climate scientists of the role of the sun and orbital variations affecting climate was presumably due to the way scientists have a tendency to work in silos of specialisation.
5. CO<sub>2</sub> is being falsely demonised as a “pollutant” by those who should know better! It is non toxic, colourless and odourless, but immensely beneficial to all plant life. Animals and plants have a symbiotic relationship, in which animals inhale air, use the oxygen from it and exhale CO<sub>2</sub> as a waste gas; and yet plants inhale air, use the CO<sub>2</sub> from it to stimulate growth and then exhale oxygen as a waste gas. It is a large excess of oxygen that both animals and plants find poisonous – not CO<sub>2</sub>. The idea that CO<sub>2</sub> is a pollutant is repugnant as well as being factually incorrect. All plants will die if atmospheric CO<sub>2</sub> drops below 150ppm. Plants prefer 2,000ppm, which is why greenhouse operators pump in CO<sub>2</sub> to provide optimum growing conditions. Plants require three things for their growth and prosperity. They are

light to aid photosynthesis, water and CO<sub>2</sub>. The greater the CO<sub>2</sub>, the more drought resistant vegetation becomes. As a result of the increase of CO<sub>2</sub> from 280ppm in 1880AD to 412ppm today, the world's deserts are now greening as jet streams weaken and go out of flow in the current "Eddy Grand Solar Minimum". While volcanoes and human emissions add CO<sub>2</sub>, H<sub>2</sub>S and SO<sub>2</sub> to the atmosphere, the only thing that adds oxygen is the plants exhaling it. We therefore depend heavily on our symbiotic relationship with vegetation.

6. The IPCC press releases show films of factory and power plant chimneys purporting to emit CO<sub>2</sub> pollution into the atmosphere. (yet CO<sub>2</sub> is both invisible and non toxic) This demonization of a gas that is essential for ALL life on earth is blatantly false because the bulk of those emissions shown on film are either water vapour or real pollutants. The UN IPCC regards demonising of CO<sub>2</sub> as justified, and by conflating CO<sub>2</sub> with poisonous substances they deliberately confuse the sensible battle against pollution (which kills many millions each year) with their faux war on climate change (which has no scientific basis and is out of our control to change). The latter is a war which cannot possibly be won. It takes somewhere between 800 and 2000 years to reduce atmospheric CO<sub>2</sub> levels (as per Vostok ice core evidence) and there is insufficient energy from other resources, or supporting energy technology to replace fossil fuels – even if the dozens of trillions of dollars being hoped for by the UN IPCC were available to make the change. Atmospheric CH<sub>4</sub> discharge disappears altogether with less than 9 years as the "C" attaches to oxygen and becomes CO<sub>2</sub>, and the H<sub>4</sub> changes into water vapour and clouds. CH<sub>4</sub> emissions simply don't matter.
7. The variations in earth's climate shown by the IPCC reports are predicated on the presumption that the heating that is occurring is in some way abnormal. The climate is entirely normal and temperatures are within historical natural climate variability, as are sea levels. By taking a temperature starting point in 1850AD at the end of the Little Ice Age, the alarmists pre-judge the current temperature as "bad" and "abnormally high", whereas over the longer term, the earth's climate is relatively cool today. We are still in the Pleistocene era and it is essentially an Ice Age. Normally NOAA ( the global supplier of temperature data) cherry-picks the starting point of their graphs for maximum effect. So for example they select 1976 as the date to begin the graphs of Arctic sea ice, instead of 1972 when Arctic sea ice extent and volume was similar to that today. IPCC figures often contain bias.
8. Shellfish use CO<sub>2</sub> to build their aquatic homes and defences. The argument that the oceans are acidifying and damaging shellfish are misleading. If the argument is being presented that the oceans are losing CO<sub>2</sub>, it can only be into the atmosphere and that would give the lie to the IPCC position that atmospheric CO<sub>2</sub> increases are primarily being caused by human emissions. Even sub-sea volcanism is potentially a source of atmospheric CO<sub>2</sub>.
9. The IPCC scientists either ignore or downplay the influence of the solar cycles on climate change in their modelling and yet solar variability has been proven as a major cause of significant fluctuations for centuries. The sun supplies more than 99% of earth's energy, so why would minor variations in solar output not make a big temperature difference?
10. The IPCC scientists either ignore or downplay the impact of the Milankovich cycles on climate change and yet the location of earth on its eccentric 100-140,000 year orbital cycle has taken earth much further away from the sun during ice ages. Each year it is the tilt of each hemisphere towards or away from the sun that determines the change of seasons. The Regular Milankovich cycle of 90-100,000 year long ice ages may cause earth's temperature to reduce by 10-12 degrees Celsius. We are 11,500 years into a 10-11,000 year interglacial interval, so why is there such warming alarmism when major cold events are past due?

11. During warmer years, polar bears thrive – as they are doing today with their numbers and food sources on the rise. Polar bears during the last 3,600 years have survived at least three warmer periods than today (the Minoan Warm Period, the Roman Warm Period and the Mediaeval Warm Period). Polar bears have black skins to absorb more warmth from sunlight and white fur to camouflage them from their prey. Using polar bears as the poster child of a warming disaster involves the deliberate deception that they are somehow in trouble and this narrative seems intended to be a prop to the fraud.
12. Hysterical claims of the fragility of polar ice caps and the Greenland ice sheet are over hyped. There is plenty of historical precedent for polar ice being both higher and lower than it is today. As far back as 1900AD. The same goes for the Antarctic. Alarmist warnings that our children will never see snow again have been proven wrong, just as many places are breaking records for snow depths and cold this year. In a rush to claim all glacial melts as being due to climate change, the fact that there are active volcanoes under glaciers in Antarctica, Greenland, Iceland, USA and Canada goes without comment.
13. The deliberate alteration of historic temperature records in order to maximise the Modern Warm Period by NOAA and others could be seen as a deliberate fraud when altered in the first years of the 21<sup>st</sup> century and the false figures are still being used today to lie to the general public about the rate of atmospheric warming during the 20<sup>th</sup> Century. The NOAA publication of their fraud coincided with the temperature pause from 2000 onwards. It also coincided with the decision to defame all sceptics by re-labelling them as “climate change deniers”, and with “Climategate” - the revelation that IPCC agencies conspired to alter temperature data. I have yet to hear of any of the maligned scientists disagreeing with the proposition that the climate is changing and always has done so. But falsification of data has provided the IPCC with the opportunity to continue the mega-fraud long after solar activity has now started to fall and temperatures have stubbornly failed to increase.
14. Wherever the scientific consensus has disagreed with the various UN IPCC reports (as it often did during their drafting), the wording of the consensus was deliberately changed by IPCC insiders (politicians and administrators -not scientists) to meet the political opinions and dogma of the UN IPCC. Summaries for politicians were often totally at variance with the facts because they were compiled by the political IPCC elite.
15. The often published falsehood that 97% of climate experts say that global warming is primarily caused by human carbon emissions is at total variance with the facts. From the corrupted study by John Cook of Sydney which is being used to justify that 97% claim, if it were said that 3% of papers studied by John Cook agreed with that claim, that would be far more accurate. But the IPCC claim of 97% is a deliberate untruth to help politicians secure public funding for the fraud. Climate science is not settled, and, as the fields of space weather and solar and various earth sciences are being brought to bear the UN IPCC’s published reports are being proven false. In 1998, 31,487 scientists in the United States, including 9,029 with Ph.Ds, signed a petition reading in part, “There is no convincing scientific evidence that human release of carbon dioxide, methane, or other greenhouse gases is causing or will, in the foreseeable future, cause catastrophic heating of the Earth’s atmosphere and disruption of the Earth’s climate.” Most of the current listed signatories signed or re-signed the petition after October, 2007. A directory of signers, sorted by state, was published in 2009 as an appendix to [\*Climate Change Reconsidered\*](#), the 2009 Report of the Nongovernmental International Panel on Climate Change (NIPCC). Also, 49 eminent

astronauts and scientists from NASA have demanded that NASA correct their reports and record.

16. Global warming alarmists refuse to debate their position or reveal the calculations behind their commitment to the human caused global warming narrative. When subsidiary frauds are drawn to their attention, they claim innocence, yet the same untruths keep popping up in the media. The conclusion that human caused global warming has been comprehensively debunked is being covered up or supported by an IPCC complicit media. A US Presidential investigation is now commencing which will explore the scientific facts in 2019.
17. The results of various published IPCC climate change accords have been grossly overstated. Few of those countries attending Paris have real plans to comply with their professed CO<sub>2</sub> reductions at that and subsequent conventions. Those that have tried to comply are now facing a backlash as their energy costs become unsustainable – and despite that, the only countries (other than USA which has achieved a reduction in carbon emissions due to change from coal fired power plants to gas fired) are seemingly unable to make progress with any reductions. On the other hand, the likes of India, China and all emerging economies – even Japan and Brazil - will continue to increase emissions as and when it suits. It appears that guilt over carbon emissions is just a delusion of left wing OECD bureaucrats and scientists, while actively promoted by commercial interests to their own benefit.
18. Recent history shows that every desperate warning of runaway heating from the IPCC has been proven false since 1989 when they first claimed the earth had only 10 years to avert runaway warming. Current reports that we have only 12 years to Armageddon are based on erroneous figures from Scripps Oceanographic Institute. These and similar “mistakes” do sometimes get acknowledged, just they never ever get corrected or published.
19. Of all IPCC models costing hundreds of billions of dollars over the last 30 years, none have been able to predict current temperatures and all forecasts have been grossly inaccurate. Modelling has been proven to be a total waste of time and money.
20. Sea levels have been increasing at about 1.3 to 1.8 mm per year since 1900 according to tide gauges. Although the first IPCC reports attributed this rise to increasing ocean temperatures, the measured temperature changes have been too small. Now it is considered that sea level changes over the last few centuries have been largely in response to changing volumes of water stored on land, mostly as glaciers and icecaps. The mass balance of glaciers and ice caps depends on several factors including precipitation patterns, the amount of solar radiation, and air temperature. It also shows lagged responses to changes in these factors due to the time taken for ice to be transported from the areas of accumulation to areas of loss (Small glaciers respond faster than large glaciers and ice caps). This means that there is no simple relationship between air and ocean temperatures and the observed sea level responses. The IPCC modelling assumes that the complex behaviour observed can be modelled based primarily on air temperature. The failure of the models to correctly predict sea level behaviour indicates this is not true.

The relevance of the sun recently moving into an inactive phase called a Grand Solar Minimum during solar cycle 23 and now at the end of solar cycle 24, will likely continue and eventually accelerate a cooling trend for earth's climate and the continued perturbation of earth's tectonic plates due to the changed solar magnetosphere. The freezing temperatures throughout the Northern Hemisphere this winter and last, together with the abnormal rain storms reminiscent of the Little Ice Age will continue to collapse the credibility of politicians trusting, ignorant, or foolish

enough to rely on the coterie of global warming hypotheses – all now un-proven or disproven. Natural climatic variability is a problem we need to adapt to, because we cannot confront it.

For the period since satellite records began, the global atmospheric temperature increase to the end of March 2019 is now down to only 0.34 degrees Celsius. (That is the only tamper-proof temperature data now available.) That doesn't support the notion of runaway global warming.

This year it is claimed the global warming industry will be worth USD1.5 trillion and its total worth is climbing rapidly. It is simply a USD1.5 trillion fraud that will continue to get bigger.

John Rofe, AUCKLAND, NZ.
